Minneapolis, Minnesota, USA

RE: Assistance by Services To Be Provided in Harassment Case

Good afternoon:

By the way of introduction, my name is Edward Leszynski. I am the Operations Director of an investigation and protection firm called Special Solutions, Ltd., located in Chicago, IL., operating and licensed since 1991. I am writing this letter in the spirit of assistance to a long-term client of my firm, Ms. Smeeta Antony.

Our correspondence covering late 2016 to the Present has presented numerous instances of susceptibility to a phenomenon that we have increasingly encountered in growing numbers since 2011. This particular condition exists under a number of monikers, from remote stimulation of the mammalian brain through ELF and Microwave pulses to Electronic Harassment to being a Targeted Individual to being termed a Sensitive, but we prefer to term the condition by its medical terms: Electromagnetic Hypersensitivity, aka Idiopathic Environmental Intolerance. Manifestations of Modulation technology, used primarily in surveillance, can range from physical burn scars, lesions, and subdermal blistering in the nastier cases, but wide reports of uncontrolled muscle and limb movements, a Tourette's-like condition where a virtual Word Salad is produced, a series of episodes of Lost Time and remote sexual stimulation...the indications of this condition afflicting this particular client have been steady for at least the time I have personally corresponded with her, which has been for more than a year off and on.

Ms. Antony has received medical documentation that she is indeed Not Schizophrenic, which she has shared and is legitimate. The amount of proof and organization of the entire ordeal, as well as video and picture evidence she has submitted to us of the episodes she suffers is not easily dismissed. Her exoneration of typical diagnoses of Schizophrenia or DID from highly respected psychiatrists and medical professionals is also strong evidence of this young woman suffering from something outside herself that science is just recently beginning to catalog and quantify.

The physical and neurological side effects mirror literally Thousands of cases in our files, and her case is unique, as only a handful have suffered from the exact symptoms in just this combination. Ms. Antony is honest, upstanding, well-respected by her peers and seemed to myself and our Chief Investigator to be forthright, with much evidence in hand upon meeting us both. This is not delusion, it is a side effect of the birth of a technology most of us are two generations behind, and it's beginning to seriously make people all over the globe ill. I can personally attest to examining literally Thousands of individuals in the last six and a half years that have displayed similar symptoms and circumstances. The latest scientific and medical research available to us has determined a hypersensitivity to certain subsonic, microwave-based components present in transmissions and communications all over the globe, some hybridized with Carrier waves for cell transmission, others originating in Military and Private transmission wavelengths. What all seem to share is their parapet in the Extremely Low Frequency range.

Since the 1990's, science has been well-informed of the effects of ELF waves upon biological organisms, primarily mammals. These frequencies interrupt synapse transmission in the brain's frontal lobes, creating both physical and neurological chaos that can lead to hallucinations, hearing of transmissions or voices, and can mimic Schizophrenia minus the actual diagnosis. As such, we believe many classified as such are actually experiencing some facet of this phenomenon.

What sets this particular case apart is that Ms. Antony does seem to be legitimately targeted via a sky-based delivery platform, likely a drone or series of drones. Further determination of the source of the detected signals continues as of this writing, as word is awaited from FCC and FAA regarding drones in the area. Requests regarding current operations have been submitted to various Federal police agencies, with only DEA confirmation that there are no operations currently underway in this area.

I am also of the opinion, after viewing much video evidence, that our client is a legitimate sufferer as well. I implore you to offer her any assistance necessary with an open mind, because we are witnessing a new technology like I have never seen before, and it is affecting more and more every year, at least in my office. Medical research is open to all on the internet regarding this scourge, as well as some cases moving forward in the Washington D.C. district courts. We are watching closely the results of these cases, as it can begin to lead to some answers of how people such as my client remain susceptible to a poison that cannot be smelled, tasted, or seen.

In conclusion, I invite any and all questions regarding this phenomenon. I am an accredited Investigator and am well-known, both here in Chicago and around the continent of North America, for devising legitimate countermeasures against something that seems to be penetrating every corner of the globe. While not perfect, and not without pitfalls, the protocols we have designed to assess whether the client is faking or not have ruled that in this particular case, Ms. Anthony seems to be dealing with the real thing. I also invite you to examine the same video evidence she presented to us, in order that you may have an up close and intimate look at the way this issue can degrade the health of an individual.

I can be reached from 9 a.m. until 8 p.m. CST daily (except Sundays) on my cell at 224-470-9056, and will be happy to answer any other questions you may have. We look forward to providing some help and insight into exactly what is happening to people such as our client.

Sincerely,

Ed Leszynski, RPI
